

Plattline™ Zinc Ribbon—the Original

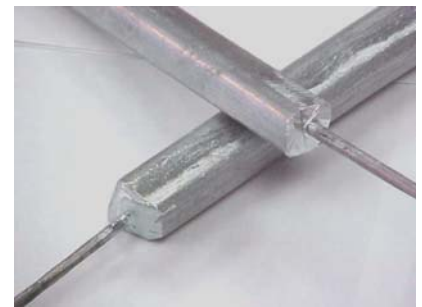

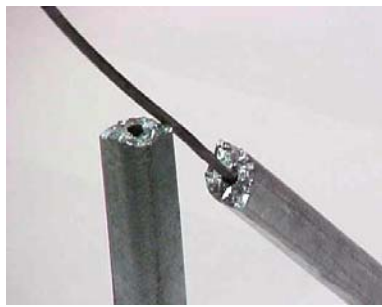

Plattline™ Zinc ribbon has become extremely popular since its creation in 1960. It has become a long-lived tool of cathodic protection for AST's, holiday protection of pipeline coatings and, an accepted grounding tool for mitigating AC current on sub-soil structures.

So popular has our Plattline™ Zinc Ribbon become that several “knock-off” versions have surfaced. They claim to be “just the same”, “just as good as Plattline™, BUT “cheaper”. There's an ancient maxim that fits this claim: “You get what you pay for”. And it's very applicable in this case . Here's why!!!!

Your cathodic protection systems are designed for 20 years or longer. In order for you to warranty your design with Plattline™, you must have a zinc ribbon that does not CRACK, does not FALL APART, is flexible enough to withstand the rigors of installation as well as the soil movements that occur over its life, and maintains an intimate bond between steel wire core and zinc.

Other Zinc Ribbons

Plattline™
Know The Difference

Notice that the core wires slide completely out of the “Other Zinc Ribbons”. The zinc is clearly “crystallized” and therefore brittle. Bending , uncoiling, or installing makes the steel core “break-away” from the zinc, destroying the intimate bond necessary for long-life cathodic protection for your client. **This will not occur with Plattline™ Zinc Ribbon!**
